PATENT APPLICATION TRANSMITTAL LETTER

Docket Number 6499-4

TO THE COMMISSIONER OF PATENTS AND TRADEMARKS
Washington, D.C. 20231

1c916 U.S. PTO
09/675912
09/29/00

Transmitted herewith for filing under 35 U.S.C. 111 and 37 C.F.R. 1.53 is the patent application of:

Inventor(s): John H. Kiekhaefer

entitled: "Transparent/Translucent Financial Transaction Card"

Enclosed are:

- 42 pages of written description, claims and abstract.
- 7 sheet(s) of drawings.
- an assignment of the invention to _____
- combined declaration and power of attorney of the inventor(s).
- a certified copy of a _____ application.
- associate power of attorney.
- verified statement(s) to establish small entity status under 37 CFR 1.9 and 1.27.
- information disclosure statement.
- preliminary amendment.
- other: _____

CLAIMS AS FILED

	NUMBER FILED	NUMBER EXTRA		
BASIC FEE			\$ 690	\$ 690
TOTAL CLAIMS	90 - 20 =	70	x \$ 18	\$ 1260
INDEPENDENT CLAIMS	4 - 3 =	1	x \$ 78	\$ 78
MULTIPLE DEPENDENT CLAIMS	0		x \$ 260	\$
Number Extra Must Be Zero or Larger			TOTAL	\$ 2028
If applicant has small entity status under 37 CFR 1.9 and 1.27, then divide total fee by 2, and enter amount here			SMALL ENTITY TOTAL	\$ 1014

- A check in the amount of \$ _____ to cover the filing fee is enclosed.
- The Commissioner is hereby authorized to charge and credit Deposit Account No. _____ as described below.
- Have enclosed a duplicate copy of this sheet.
- Charge the amount of \$ _____ as filing fee.
- Credit any overpayment.
- Charge any additional filing fees required under 37 CFR 1.16 and 1.17.
- Charge the issue fee set in 37 CFR 1.18 at the mailing of the Notice of Allowance, pursuant to 37 CFR 1.31(b).

Date: September 29, 2000

**VERIFIED STATEMENT CLAIMING SMALL ENTITY STATUS
(37 CFR 1.9(f) & 1.27(c)) -- SMALL BUSINESS CONCERN**

Docket Number: 6499-4

Applicant or Patentee: John H. Kiekhaefer

Serial or Patent Number: _____

Filed or Issued: _____

Title: Transparent/Translucent Financial Transaction Card

I hereby declare that I am

the owner of the small business concern identified below:
 an official of the small business concern empowered to act on behalf of the concern identified below:

NAME OF SMALL BUSINESS CONCERN Perfect Plastic Printing Corporation

ADDRESS 345 Kautz Road, St. Charles, Illinois 60174

I hereby declare that the above identified small business concern qualifies as a small business concern as defined in 13 CFR 121.12, and reproduced in 37 CFR 1.9(d), for purposes of paying reduced fees to the United States Patent and Trademark Office, in that the number of employees of the concern, including those of its affiliates, does not exceed 500 persons. For purposes of this statement, (1) the number of employees of the business concern is the average over the previous fiscal year of the concern of the persons employed on a full-time, part-time or temporary basis during each of the pay periods of the fiscal year, and (2) concerns are affiliates of each other when either, directly or indirectly, one concern controls or has the power to control the other, or a third party or parties controls or has the power to control both.

I hereby declare that the rights under the contract or law have been conveyed to and remain with the small business concern identified above with regard to the invention described in:

the specification filed herewith with title as listed above.
 the application identified above.
 the patent identified above.

If the rights held by the above identified small business concern are not exclusive, each individual, concern or organization having rights in the invention must file separate verified statement averring to their status as small entities, and no rights to the invention are held by any person, other than the inventor, who would not qualify as an independent inventor under 37 CFR 1.9(c) if that person made the invention, or by any concern which would not qualify as a small business concern under 37 CFR 1.9(d), or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern or organization having any rights in the invention is listed below:

No such person, concern or organization exists.
 Each such person, concern or organization is listed below:

FULL NAME: _____

ADDRESS: _____

INDIVIDUAL SMALL BUS. CONCERN NON PROFIT ORGANIZATION

Separate verified statements are required from each named person, concern or organization having rights to the invention averring to their status as small entities. (37 CFR 1.27)

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b)).

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

TRANSPARENT/TRANSLUCENT FINANCIAL TRANSACTION CARD
CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of application serial number 09/449,251, filed November 24, 1999, entitled "Transparent/Translucent Financial Transaction Card," which is a 5 continuation-in-part of application serial number 09/411,359, filed October 1, 1999, entitled "Transparent/Translucent Financial Transaction Card."

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention relates generally to financial transaction cards, including credit cards, 10 debit cards, ATM (Automated Teller Machine) cards, and the like. More particularly, the invention relates to financial transaction cards that are transparent or translucent to human viewing yet can be detected by sensing devices in automated card processing equipment, such as embossing/encoding machines employed during card manufacturing, and card readers, such as those found in ATMs, automated fuel dispensers, and other point-of-sale card processing equipment.

15 2. Description of the Prior Art

For some time, financial institutions have been interested in offering financial transaction cards having areas that are transparent or translucent to human viewing. Prior art efforts to achieve such design effects have produced the following examples:

20 - Cards incorporating transparent or translucent films.
- Cards incorporating transparent or translucent magnifying lenses.
- Cards incorporating transparent or translucent holograms.
- Cards incorporating transparent or translucent lenticular patterns.
- Cards incorporating other transparent or translucent optical effects.
25 - Cards that are partially transparent or translucent, but also have a high level of opacity provided by the presence of coating(s) containing fillers or pigmentation.

The perceived advantage of a transparent or translucent financial transaction card is that the card will be relatively unique in the marketplace and impart status to the card user as compared to other users who have only opaque cards. A bank or other entity offering a 30 transparent or translucent card can potentially attract users who will preferentially select such a

card over competitive opaque cards, and thereby provide income to the institution as a result of card usage.

A significant problem with transparent or translucent cards is that the cards also need to function properly when processed during manufacture in card embossing/encoding equipment, 5 and when deployed by users in card readers, such as those found in ATMs, automated fuel dispensers, and other point-of-sale card processing equipment. These machines utilize light transmission-based card sensing devices that are not able to detect the presence of transparent or translucent cards. This is due to the fact that the sensing devices, which typically comprise opposing source/detector pairs, are not able to see such cards as opaque (light blocking). The 10 light emitted from the sensing device light sources located on one side of a transparent or translucent card passes through the card rather than being blocked from reaching the detectors located on the other side of the card.

Accordingly, there is a need for a transparent or translucent financial transaction card that overcomes the foregoing problem. What is required is a financial transaction card that is 15 transparent or translucent to human viewing in one or more areas of the card, yet which is detectable by automated card processing equipment, of any type.

BRIEF SUMMARY OF THE INVENTION

A solution to the foregoing problem is provided, and an advance in the art is made, by the present invention in which a financial transaction card has one or more areas that are at 20 least minimally transparent or translucent to human viewing, yet the card is detectable by the card sensing devices of automated card processing equipment.

In preferred embodiments of the invention, the card includes a substantially planar material sheet having upper and lower surfaces bounded by a continuous peripheral edge. The material sheet is formed to include the aforementioned one or more areas that are at least 25 minimally transparent or translucent to human viewing. A filter is associated with at least one of these areas and provides sufficient opacity to light used in the card sensing devices to render the card detectable.

The automated card processing equipment may include card readers having source/detector pairs operating in a near Infrared light wavelength range of about 750-1200 30 nm, and more typically, about 850-1000 nm, and especially about 890 nm and 950 nm, which are the respective output wavelengths of two types of LEDs (Light Emitting Diodes)

commonly used as light sources in many card readers. In that case, the filter should provide opacity relative to such wavelengths of not substantially less than the opacity required by the readers. The automated card processing equipment may also include card embossing/encoding machines having source/detector pairs operating in a near Infrared light wavelength range of
5 about 830-1100 nm, and more typically, about 830-1000 nm, and especially about 920 nm and 950 nm, which are the respective output wavelengths of two types of LEDs commonly used as light sources in such equipment. In that case, the filter should provide opacity relative to such wavelengths of not substantially less than the opacity required by the equipment. If the card is
10 to be compatible with both point-of-sale card readers and card embossing/encoding machines, the filter should comply with the wavelength requirements of both types of equipment.

The filter referred to herein includes any suitable medium or device that can provide the opacity required for automated card detection. By way of example, the filter can be made from a variety of light filtering materials, including materials that are light absorbing, light reflecting, light deflecting, light scattering or the like, relative to the applicable wavelength range. The filter can also be made from various combinations of such materials. Light
15 absorbing materials that can be used for the filter include colorless light absorbers, light absorbing dyes, and other materials. Light reflecting materials that can be used for the filter include silver compositions, silver-titanium oxide compositions, and other materials. Light deflecting materials that can be used for the filter include light deflecting films. Light scattering materials that can be used for the filter include light scattering coatings. To the extent that the filter materials cause card discoloration, a suitable colorant can be introduced to
20 produce an aesthetically pleasing card color or tint.

In specific filter constructions, a light filtering material (solid or liquid) can be incorporated in a liquid carrier and applied to the material sheet using screen printing or other
25 application methods. Relatedly, the light filtering material can be similarly applied to a solid film that is then secured to the material sheet using lamination techniques, adhesive bonding, or other application methods. In alternative filter constructions, a light filtering material can be incorporated into the material sheet prior to or during extrusion or calendaring thereof (while it is a soft resin), or can be sublimated therein by heat diffusion processing, such that the light
30 filtering material is disbursed through all or a portion of the material sheet. Relatedly, the light filtering material can be similarly introduced into a solid film that is then secured to the

material sheet. In alternative filter constructions, a light filtering material can be deposited on the material sheet using a suitable deposition technique. Relatedly, the light filtering material can be similarly deposited on a solid film that is then secured to the material sheet. Still other filter constructions will no doubt become apparent to persons skilled in the art in view of the
5 teachings herein.

In the preferred embodiments of the invention, the light filtering material is a near Infrared light absorbing material, such as a light absorbing dye, and the liquid carrier is a coating material comprising an organic solvent and a plastic resin (such as vinyl resin or acrylic resin). If desired, a colorant can be added to adjust the visible coloration of the
10 resultant card. Suitable colorants include dye colorants, inks, light scattering materials, and fluorescent materials. Advantageously, the light scattering materials also provide a mechanism for reducing near Infrared light transmittance, as mentioned above. If desired, an Ultraviolet (UV) light absorbing material can be added to prevent degradation of the light filtering material.

15 BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING

The foregoing and other features and advantages of the invention will be apparent from the following more particular description of a preferred embodiment of the invention, as illustrated in the accompanying Drawing, in which:

20 FIG. 1 is a graph showing human eye sensitivity and luminosity as a function of light wavelength;

FIG. 2 is a plan view of a financial transaction card showing opacity requirements for a conventional card embossing/encoding apparatus;

FIG. 3 is a plan view of a financial transaction card constructed in accordance with a preferred embodiment of the present invention;

25 FIGS. 4a, 4b, 4c, 4d, 4e and 4f are cross-sectional views taken along line 4-4 in FIG. 3 having exaggerated thickness to show the construction of a filter in accordance with various fabrication techniques;

FIG. 5 is a graph showing opacity versus wavelength for a tested card having two filtering layers;

30 FIG. 6 is a graph showing opacity versus wavelength for a tested card having three filtering layers;

FIG. 7 is a graph showing opacity versus wavelength for a tested card having four filtering layers; and

FIG. 8 is an elevated side view of another financial transaction card having a ten layer, multiple filter construction.

5 DETAILED DESCRIPTION OF THE INVENTION

I. GENERAL CONSIDERATIONS

For purposes of the present description, a *transparent* medium will be understood to be a material that transmits human-visible light without substantial scattering. A transparent medium allows a person to view definable images through it. A *translucent* medium will be understood to be a material that transmits human-visible light but with substantial light scattering. A person will be able to see light through a *translucent* medium but will not see defined images. An *opaque* medium will be understood as blocking a substantial portion of incident light within a particular wavelength range via absorption, reflection or otherwise. If a medium is opaque to human viewing, a person will not be able to detect any light being transmitting from one side to the other. If a medium is non-opaque to human viewing, it will be at least minimally transparent or translucent and a person will be able to see at least some light being transmitted from one side to the other.

Table 1 below illustrates the correlation between density (opacity) and transmittance as these concepts will be applied in describing the preferred embodiments of the invention. Table 20 1 is based on conversion calculations of density (opacity) to transmittance using the conversion formula Density = Log (1/Transmittance).

Table 1 – Correlation for Card Density(Opacity) and Transmittance

Density (Opacity)	Approximate Light Transmittance	Density (Opacity)	Approximate Light Transmittance
0.10	79%	0.80	16%
0.20	63%	0.90	13%
0.30	50%	1.00	10%
0.40*	40%	1.30	5%

0.42	38%	1.50	3%
0.50	32%	2.00	1%
0.52	30%	3.00	0.1%
0.60	25%	4.00	0.01%
0.70	20%		
*Possible human perception limit of opacity in average visible light conditions			

The primary requirement of a financial transaction card in accordance with the invention is that it must have an area that transmits light at one or more wavelengths within the visible light range of the electromagnetic spectrum (380-750 nm) with sufficient transmittance to be perceived as being at least minimally transparent or translucent by a human viewer. Fig. 1 illustrates relative light sensitivity of the human eye as a function of wavelength. As shown therein, greatest human light sensitivity is at 550 nm. Based on visual correlation between measured card samples and human viewing of those samples under average viewing conditions (e.g., room light), and based on Table 1 above, it has been determined by Applicant that a financial transaction card should preferably transmit at least about 40% of incoming visible light for it to appear to be noticeably different from a standard opaque card to card users. However, because lower (e.g., 5-20%) or higher (e.g., 70-80%) transmittance levels may be desired, depending on customer preferences, the 40% level should not be construed as limiting relative to the invention. For example, Applicant has produced financial transaction cards having a visible light transmission level of about 19% (0.72 opacity) and this card can be considered translucent. In some cases, it may be possible to lower the transmittance level to about 0.5 % (1.3 opacity) before most individuals will not be able to see light through the card in normal room lighting. As a practical requirement for financial transaction cards that are transparent or translucent to visible light, yet still detectable by automated card processing equipment, a minimal transmittance level of about 15 % visible light may be used.

As indicated above, a financial transaction card need not transmit light at all wavelengths within the visible light range to be considered transparent or translucent. That is, the light being transmitted through the card need not encompass the full visible spectrum, such that the card appears colorless. It is sufficient that the transmitted light be constituted at some

human visible wavelength, or at multiple human visible wavelengths, at some minimal level of transmittance which is sufficient for human recognition.

As used hereinafter, when speaking of the transmittance-opacity of a financial transaction card in the human-visible light range, it will be understood that the card has been measured with respect to at least one human-visible wavelength. This is seen in examples 1-5 below wherein transmittance-opacity is measured at 550 nm, the wavelength of greatest human light sensitivity. In other cases, and particularly examples 6-9 below, transmittance-opacity in the visible light range is measured more broadly across multiple visible wavelengths. In particular, an X-Rite 361T Densitometer, made by X-Rite, Inc. of Grandville, Michigan, is used to measure visible light transmittance-opacity in these examples. This machine measured over a range of about 400-750 nm, and may be considered to provide a more accurate measurement of human visible light transmittance than measurements taken at a single visible light wavelength.

II. CARD READER CONSIDERATIONS

As indicated by way of background above, the devices for sensing the presence of financial transaction cards in point-of-sale card readers generally consist of a light source and a light detector paired together to identify the presence of a card if light emitted by the source is blocked from reaching the detector. The absence of a card is identified if there is light transmission to the detector. Typically, multiple source/detector pairs are employed. At least one pair is located at or near the card insertion slot and additional pairs are usually spaced over the entire surface of the card. In order for a financial transaction card to be detected in a card reader, it must be substantially opaque to the detectors.

The light sources used in card readers are usually LEDs. These generally have characteristic narrow output peaks lying within a wavelength range of about 750-1200 nm. In particular, most older card readers use LEDs operating at about 890 nm, while most newer card readers use LEDs operating at about 950 nm. On the other hand, the detectors in card readers typically have broad sensitivity across the 750-1200 nm wavelength range. According to the standard known as "WP7810," in order for a financial transaction card to be able to block the detectors in a typical card reader from seeing the LED output, such that card detection can occur, the card must have a minimum opacity relative to the LED output wavelengths of between about 1.1 and 1.3. Of course, this range may not apply to all card readers currently in

use, and it may not apply to future card readers in the event that design changes are made. Indeed, Applicant has observed that whereas a minimum opacity of between about 1.0-1.3 may be safely used as a lower limit in many cases, other card readers require higher opacities of about 1.5, or even about 2.00. Generally speaking, opacities of about 1.0-1.3 will be sufficient
5 for card detection in card readers that are considered to be "fault tolerant." Such machines will allow a maximum transmission level of 10% (1.0 opacity). Other card readers are considered to be "non-fault tolerant" and will allow a maximum transmission level of 3 % (1.5 opacity). Still other card readers are considered to be "high security" and will allow a maximum transmission level of only 1 % (2.0 opacity).

10 III. EMBOSsing/ENCoDING MACHINE CONSIDERATIONS

Conventional financial transaction card embossing/encoding machines used during card manufacture typically employ multiple sensors of the source/detector type to determine the presence and proper positioning of the cards. For example, the DataCard 9000 machine, manufactured by Datacard Corporation of Minnetonka, Minnesota, has more than fifteen
15 sensors that check for opacity across portions of the card surface. These portions are shown in Fig. 2, which illustrates a card 10 having opaque areas conforming to the requirements of the DataCard 9000 machine. In order for the DataCard 9000 machine to function properly, a first band 12 is required to be opaque and have a band height of at least 0.826 inches, and a second band 14 is required to be opaque and have a band height of at least 1.000 inches. The
20 remaining band 16, having a nominal band height of 0.389 inches, has no requirement for opacity. It will be appreciated that other embossing/encoding equipment may have different opacity requirements.

In the DataCard 9000 machine, the card sensors are said to detect in the near Infrared spectral region, and specifically in a wavelength range of about 830-1100 nm. More
25 particularly, it is understood that the LED light sources in the card sensors of this machine transmit light at about 950 nm. According to the manufacturer's specifications, to be detected by a DataCard 9000 machine, the bands 12 and 14 of the card 10 must have a minimal measured opacity of 1.0 (10% transmittance) in this spectral region. Another commonly used LED output wavelength used in embossing/encoding machines is about 920 nm.

IV. PREFERRED TECHNICAL SOLUTION PROVIDED BY THE INVENTION

Turning now to Figs. 3 and 4a-f, a financial transaction card 20 constructed in accordance with a preferred embodiment of the present invention includes a substantially planar material sheet 22 made from polyvinyl sheet stock or other suitable material. The material sheet 22 has upper and lower surfaces 24 and 26, respectively, and a continuous peripheral edge 28. The material sheet 22 is provided with one or more areas that are at least minimally transparent or translucent relative to human viewing. In Fig. 3, reference number 30 identifies one such area extending over the entire surface of the material sheet 22. To achieve this configuration, the material sheet 22 is preferably made entirely from transparent or translucent (polyvinyl, acrylic, polyester, etc.) sheet stock. To render the area 30 opaque to the card sensing devices of automated card processing equipment, a filter, partially illustrated by reference numeral 32, is provided. As shown in Figs. 4a-f, the filter 32 can be located at the upper surface 24 of the material sheet 22, or at any location below the upper surface. For example, although not shown, the filter 32 could also be located at or near the lower surface 26 of the material sheet 22. As shown in Fig. 4c, the filter 32 may be disbursed throughout the material sheet 22, in which case the filter will be simultaneously located at the material sheet's upper surface, lower surface, and at locations therebetween.

The filter 32 is designed to provide opacity relative to wavelengths that are within the active wavelength range of the source/detector pairs used in the card sensing devices of card processing equipment, such as embossing/encoding machines and card readers. Considering sections II and III above, the worst-case scenario may be provided by card readers, which have source/detector pairs placed across the entire card surface, and which appear to require a minimum opacity of between about 1.0-1.3 at one or more specific wavelengths within the 750-1200 nm wavelength range, i.e., at the wavelengths output by the card reader LEDs. The filter 32 should thus preferably be designed to these specifications. One way to satisfy this goal relative to the card 20 is to extend the filter 32 over the entirety of the transparent or translucent area 30 of the material sheet 22, i.e., over the entire card 20, and provide an opacity of at least about 1.0-1.3 over the entire 750-1200 nm card reader wavelength range.

Alternatively, as discussed relative to Figs. 5-7 below, the filter 32 can be tailored to provide the required opacity relative to the specific wavelengths output by card reader LEDs. In either

case, higher opacities on the order of 1.5 and 2.0 will be respectively required for non-fault tolerant and high security card readers.

The filter 32 can be made in a variety of ways. For example, it can be made from a light filtering material that is either light absorbing, light reflecting, light deflecting, light scattering or the like, relative to the applicable wavelength range. The filter 32 can also be made from various combinations of such materials. Light absorbing materials that can be used for the filter 32 include colorless light absorbers, light absorbing dyes, and other materials. In the event that dyes are used, a suitable colorant may be added to the card as necessary to provide an aesthetically pleasing card color or tint. Suitable colorants include dye colorants, light scattering materials, and fluorescent materials. Light reflecting materials that can be used for the filter 32 include silver compositions, silver-titanium oxide compositions, and other materials. Light deflecting materials that can be used for the filter 32 include light deflecting films. Light scattering materials that can be used for the filter 32 include light scattering coatings.

In specific constructions, the filter 32 can be fabricated and applied to the material sheet 22 in a variety of ways. In Fig. 4a, a suitable light filtering material, such as a near Infrared light absorbent dye powder, is added to a suitable liquid carrier, such as a coating material comprising an organic solvent and a plastic resin (plastic resin-based coating). Suitable plastic resins include (but are not limited to) vinyl resin (producing a vinyl resin-based coating) and acrylic resin (producing an acrylic resin-based coating).

If a light absorbent dye and a plastic resin-based coating material are used to form the filter 32, the dye can be combined with the coating material at a dye-to-coating weight ratio of up to about 20% (depending on the number of filter layers being applied (see below)). More preferably, the dye-to-coating weight ratio is between about 0.2%-5.0%, and still more preferably between about 0.5%-3.5%, and most preferably between about 1.0%-2.5%. If desired, an appropriate thinner can be used to pre-dissolve the dye prior to adding it to the coating material.

The filter 32 can be applied as a filter coating 40 to the material sheet 22 (e.g., made from polyvinyl sheet stock), using screen printing at a mesh size ranging from about 90-390 mesh. Other application methods can also be used, including roll coating, flexography, wire-wound rod application, and others. One or more layers (e.g. 2-4 layers) of the filter

coating 40 can be applied to the material sheet 22 as necessary to obtain the needed near Infrared opacity.

One or more colorants may be used in the foregoing application to adjust the color of the resultant card, as can fluorescent materials and light scattering materials. The fluorescent

5 and light scattering materials have the additional benefit of acting as light blocking enhancers.

Dye colorants can be added to the liquid carrier used to form the filter coating 40 prior to its application to the material sheet 22. Fluorescent materials can be added in the same way.

Light scattering materials can be added by mixing them in the same type of carrier used for the filter coating 40, and applying the mixture as a separate coating to the material sheet 22, e.g.,

10 on the side that is opposite the filter coating.

If a light absorbent dye is used as the filtering material in combination with a plastic resin-based coating material, the issue of UV light and/or heat instability may be presented. Some solvent-soluble dyes will degrade in the presence of free radicals that can be generated when the financial transaction card is exposed to sunlight or to heat during lamination

15 processing at high temperatures. As described in more detail below, these concerns can be addressed by lowering lamination processing temperatures from the usual processing range of about 270-300 degrees F to about 230-270 degrees F. Additionally a stable dye, or a mixture of a stable dye and a less stable dye combined at a suitable weight ratio (e.g., about 1:10 to 1:5) of stable dye to less stable dye, may be used. An antioxidant stabilizer may also be added to

20 function as a free radical absorber. It can be added to the dye/coating mixture prior to its application to the material sheet 22 as the filter coating 40. More preferably, however, the stabilizer is applied as a separate cover layer over the filter coating 40 after the latter has been applied to the material sheet 22.

In Fig. 4b, a suitable light filtering material (e.g., a light absorbent dye) is added to a suitable liquid carrier (e.g., a plastic resin-based coating material) and applied as a coating 40 (see description of Fig. 4a) on a film 42 (e.g., made from the same material as the material sheet 22) using screen printing or other methods. The film 42 is then itself secured to the material sheet using lamination techniques, adhesive bonding, or other application methods.

In Fig. 4c, a suitable light filtering material is incorporated into the material sheet 22 prior to or during calendaring or extrusion thereof (when it is a soft resin), or is sublimated

Financial Transaction Card

15

20

30

therein by heat diffusion processing, such that the light filtering material is disbursed through all or a portion of the material sheet.

In Fig. 4d, a suitable light filtering material is incorporated in a film 44 during calendaring or extrusion thereof (when it is a soft resin), or is sublimated therein by heat diffusion processing. The film 44 is then itself secured to the material sheet 22 using lamination techniques, adhesive bonding, or other application methods.

In Fig. 4e, a suitable light filtering material, such as a silver-titanium oxide coating material, is deposited on the material sheet 22 using a suitable deposition technique (e.g., vacuum deposition). Multiple layers (e.g., 2-4) may be applied as necessary to obtain the required opacity.

In Fig. 4f, a suitable light filtering material is deposited on a film 46 using a suitable deposition technique and the film is then itself secured to the material sheet 22 using lamination techniques, adhesive bonding, or other application methods.

Still other filter constructions will no doubt also be apparent to persons skilled in the art in view of the teachings herein. Specific construction examples follow:

Example 1

In this example, 22 grams of a first near Infrared powdered absorption dye, sold under the name ADS1065A by American Dye Source, Inc. of Mount Royal, Quebec, Canada, and 3 grams of a second (more light and heat stable) near Infrared powdered absorption dye, sold under the name ADS870MC by American Dye Source, Inc. (both dyes being organic solvent-soluble), were pre-dissolved in 110 grams of an organic solvent-based thinner sold under the name Nazdar VF 190 by Nazdar Co., Inc. of Chicago, IL.

The foregoing mixture was combined with 990 grams of a clear vinyl resin-based coating material, sold by Nazdar Co., Inc. under the name Nazdar 132688AB. The Nazdar 132688AB vinyl resin-based coating material is understood to include the following components (with all percentages being by weight):

Vinyl resins	20-25%
Petroleum Distillates (Aromatic)	35-40%
Cyclohexanone	5-10%
Diacetone Alcohol	5-10%
Gamma Butyrolactone	5-10%

Naphthalene less than 5%
Petroleum Distillates (Aliphatic) 2%

The Nazdar VF 190 thinner is understood to have the same organic solvent components and component ratios, but does not have the vinyl resins.

Because the resultant solution had a yellow tint, two organic, solvent-soluble colorants were used to add violet color to the solution to yield a neutral gray tint in the cards produced. These colorants are sold by CIBA Specialty Chemicals of Tarrytown, NY, 15 under the names Orasol Red BL 125414AA and Orasol Blue GN 0180146AA. The amount of colorant added was 0.25 grams of the red colorant and 0.35 grams of the blue colorant. The foregoing filtering mixture was stirred at room temperature for approximately 15 minutes and then coated onto a transparent 15 mil calendered vinyl film with screen printing using a 195 mesh screen. In the card samples produced, 2, 3 and 4 layers of the filtering mixture were respectively used in making three different groups of the samples. The coated film was then compression laminated onto a transparent 15 mil polyvinyl base sheet (approximately 30 mil total card thickness).

Cards constructed according to this example were tested and found to be detectable by card readers used in ATM machines. In addition, the cards were subjected to spectrographic analysis. Figs. 5, 6 and 7 illustrate the results of that analysis. Fig. 5 shows test results for a 2-layer card, Fig. 6 shows test results for a 3-layer card, and Fig. 7 shows test results for a 4-layer card. In each figure, opacity is plotted against wavelength, and the current WP7810 minimum opacity range limits of 1.1 and 1.3 are also highlighted.

As shown in Fig. 5, with 2 filtering mixture layers, the opacity was about 0.4 (40% transmittance) when measured at a visible wavelength of 550 nm. In the near Infrared light range, the opacity begins at approximately 0.6 (25% transmittance) at the 750 nm wavelength threshold and climbs until it reaches an opacity of approximately 1.1-1.3 (7-5% transmittance) at wavelengths of approximately 880-895 nm. At a wavelength of 890 nm, the opacity is about 1.3 (5% transmittance). The opacity then continues to increase until it peaks at approximately 1.7 (2% transmittance) at a wavelength of approximately 960 nm, and then begins to gradually taper off, although never dropping below an opacity of 1.3 (5% transmittance) through at least a wavelength of about 1100 nm. At a wavelength of 950 nm, the opacity is about 1.7 (2% transmittance).

As shown in Fig. 6, with 3 filtering mixture layers, the opacity was about 0.6 (25% transmittance) when measured at a visible wavelength of 550 nm. In the near Infrared light range, the opacity begins at approximately 0.8 (16% transmittance) at the 750 nm wavelength threshold and climbs until it reaches an opacity of approximately 1.1-1.3 (7-5% transmittance) at wavelengths of approximately 820-860 nm. At a wavelength of 890 nm, the opacity is about 1.5 (3% transmittance). The opacity then continues to increase until it peaks at an opacity of approximately 2.0 (1% transmittance) at a wavelength of approximately 940 nm. The opacity then tapers off to a level of approximately 1.5 (3% transmittance) at a wavelength of approximately 1020 nm, and then begins increasing again such the opacity remains above 1.3 (5% transmittance) through at least a wavelength of about 1100 nm. At a wavelength of 950 nm, the opacity is about 1.9 (1% transmittance).

As shown in Fig. 7, with 4 filtering mixture layers, the opacity was about 0.7 (20% transmittance) when measured at a visible wavelength of 550 nm. In the near Infrared light range, the opacity begins at approximately 0.9 (13% transmittance) at the 750 nm wavelength threshold and climbs until it reaches an opacity of approximately 1.1-1.3 (7-5% transmittance) at wavelengths of approximately 805-830 nm. At a wavelength of 890 nm, the opacity is about 2.0 (1% transmittance). The opacity then continues to increase until it peaks at an opacity of approximately 2.6 (0.2% transmittance) at a wavelength of approximately 940 nm. The, opacity then tapers off to a level of approximately 1.7 (2% transmittance) at a wavelength of approximately 1000 nm, and then reaches another opacity peak of approximately 2.0 (1% transmittance) at a wavelength of approximately 1040 nm. Tapering again occurs to an opacity of approximately 1.6 (2.5% transmittance) at a wavelength of approximately 1080 nm, whereupon the opacity again begins to increase such the opacity remains above 1.3 (5% transmittance) through at least a wavelength of about 1100 nm. At a wavelength of 950 nm, the opacity is about 2.5 (0% transmittance).

Example 2

In this example, 13.00 grams of a near Infrared absorption dye powder, sold under the name Epolight III-57 by Epolin of Newark, NJ, and 4.33 grams of an organic solvent-soluble UV absorber, sold under the name Cyasorb UV 5411 from Cytec Industries, Inc. of West Paterson NJ, were pre-dissolved in 130.00 grams of the Nazdar VF 190 thinner. The Epolight-57 dye is an Antimony-based, organic solvent-soluble material having good visible

light transmittance, good heat stability and maximum light absorbence at a wavelength of about 950 nm.

The foregoing mixture was combined with 633.00 grams of the Nazdar 132688AB material. To adjust the resultant color and offset the yellow tint of the Epolight material, two 5 organic solvent-soluble fluorescent colorants were added. These colorants are sold by Day-Glo Color Corp. of Cleveland, OH under the names DayGlo Blue VC19 and DayGlo Red VC11. The amount of each of the colorants was 21.66 grams. The foregoing filtering mixture was stirred at room temperature for approximately 15 minutes and then coated onto a transparent 15 mil calendered vinyl film with screen printing using a 195 mesh screen. The coated film was 10 then compression laminated onto a transparent 15 mil polyvinyl base sheet (approximately 30 mil total card thickness). The opacity measured at a visible wavelength of 550 nm was about 0.2 (63% transmittance) for cards produced according to this example. In the near Infrared light range at 950 nm, the opacity was slightly greater than about 1.0 (10% transmittance).

Example 3

In this example, 15.00 grams of the Epolight III-57 absorption dye and 4.5 grams of the Cyasorb UV5411 UV absorber were mixed with 980.5 grams of the Nazdar 132688AB material. The foregoing filtering mixture was stirred at room temperature for approximately 15 minutes and then coated onto a transparent 15 mil calendered vinyl film with screen printing using a 195 mesh screen. The opacity measured at a visible wavelength of 550 nm was about 20 0.2 (63% transmittance) for cards produced according to this example. In the near Infrared light range at 950 nm, the opacity was about 1.2 (6% transmittance).

Example 4

In this example, 13.00 grams of the Epolight III-57 dye and 4.33 grams of the Cyasorb UV 5411 UV absorber were pre-dissolved in 130.00 grams of the Nazdar VF 190 thinner. This 25 mixture was combined with 633.00 grams of the Nazdar 132688AB material. To adjust the resultant color and offset the yellow tint of the Epolight material, the fluorescent colorants of Example 2 were added to the coating. The amount of fluorescent material added was 65.00 grams of the DayGlo Blue VC19 material and 21.66 grams of the DayGlo Red VC11 material. The foregoing filtering mixture was stirred at room temperature for approximately 15 minutes 30 and then coated onto a transparent 15 mil calendered vinyl film with screen printing using a 195 mesh screen.

In addition to the foregoing, the vinyl film to which the filtering mixture was applied was also coated (on the opposite side from the filtering mixture) with a mixture containing 907.50 grams of the Nazdar 13288AB material, 90.00 grams of a translucent light scattering material sold under the name Silver Fox Fine Pearl by FM Group Inc. of Sloatsburg, NY, and 5 2.50 grams of a fluorescent whitening agent sold under the name Uvitex OB by CIBA Specialty Chemicals of Tarrytown NY.

The foregoing mixture was coated on the vinyl film using a 195 mesh screen, prior to applying the filtering mixture. The coated film was then compression laminated onto a transparent 15 mil polyvinyl base sheet (approximately 30 mil total thickness). The opacity 10 measured at a visible wavelength of 550 nm was about 0.8 (16% transmittance) for cards produced according to this example. In the near Infrared light range at 950 nm, the opacity was about 1.5 (3% transmittance).

Additionally, it has been found that the use of transparent fluorescent pigments, such as the DayGlo materials described above, can neutralize the yellow-green color of the near 15 Infrared absorbing material with less darkening than can standard pigments and dyes. Fluorescent materials have the property of absorbing light in one region of the spectrum and re-emitting light in the visible region (400-700 nm). This has the effect of brightening the appearance of materials to which they are added.

Applicant has also discovered that the addition of light scattering mechanisms to the 20 card can work in conjunction with the light filtering material. For example, the above-described Silver Fox Fine Pearl translucent material is a light scatterer. It appears that unidirectional light from a near Infrared light source is scattered in all directions so as to reduce the amount of light seen by an opposing detector. The same amount of light is being transmitted through the card (at any wavelength), but only a small amount is seen as 25 unidirectional light by the detector. Test data indicates that the amount of light seen by the detector can be reduced by as much as about 50% by the addition of light scattering mechanisms.

Another light scattering mechanism is to manufacture the card with a flat (as opposed to 30 gloss) surface. The application of this type of surface to one or both sides of the card will reduce light seen by the detector by up to about 50%.

A preferred light scattering material was found to be retro-reflective beads (glass spheres) such as T4 beads from Potters Industries Inc. of Valley Forge, PA. Prototype samples were made by applying the beads evenly across a wet coating on a vinyl sheet and then drying the coating. The vinyl sheet was then laminated as a card. Spectrophotometer 5 readings across the spectrum were in the 15-20% transmittance range as only this portion of all wavelengths was being allowed to transmit through the material unidirectionally. Of significance is the fact that the index of refraction of the glass sphere beads is 1.90 as compared to 1.50 for the vinyl sheeting.

It is noteworthy that reduction of measured transmittance by a spectrophotometer or 10 reduction of light seen by a detector in a card sensing device through light scattering mechanisms works across the entire light spectrum. The visible spectrum is affected as much as the near Infrared region. Thus, the overuse of light scatterers will work against the requirement for a card that is transparent with respect to human-visible light.

Example 5

15 A silver-titanium oxide coating, sold under the registered trademark SOL-MOX by Innovative Specialty Films LLC, of San Diego, CA, was applied to the surface of a transparent 3 mil polyester film using vacuum deposition processing. In the card samples produced, four such film layers were formed and compression laminated onto a transparent polyvinyl base sheet (30 mil total thickness). Note that the cards produced in accordance with this example 20 were somewhat opaque in the visible light range and this production method is therefore not as preferred as the production methods of previous examples.

Following are additional examples in which multiple filtering layers are used to produce financial transaction cards in accordance with the invention. The basic design model used for these examples is a ten (10) layer card in which the layers are as follows:

25	Layer 1	Clear Protective Overlay	-----
	Layer 2	Printed Graphics on Layer 3	-----
	Layer 3	Light Filtering Coating on Layer 4	-----
	Layer 4	Clear Plastic Core Stock	-----
	Layer 5	Light Filtering Coating on Layer 4	-----
30	Layer 6	Light Filtering Coating on Layer 7	-----
	Layer 7	Clear Plastic Core Stock	-----

Layer 8	Light Filtering Coating on Layer 7	-----
Layer 9	Printed Graphics on Layer 8	-----
Layer 10	Clear Protective Overlay	-----

Fig. 8 illustrates a side view of the foregoing card (50). Fabrication is performed as

5 follows: The light filtering coating layer 3 is applied to completely cover one side of the clear plastic core stock layer 4, and the light filtering coating layer 8 is applied to completely cover one side of the clear plastic core stock layer 7. As is conventional, each clear plastic core stock layer 4 is a rectangular planar sheet of sufficient size to produce one or more finished cards.

10 The printed graphics layer 2 is then printed onto the light filtering coating layer 4 and the printed graphics layer 9 is printed onto the light filtering coating layer 8. The light filtering coating layer 5 is next applied to the clear plastic core stock layer 4, on the side opposite layers 3 and 2. The light filtering coating layer 6 is applied to the clear plastic core stock layer 7, on the side opposite layers 8 and 9. The two assemblies respectively comprising the clear plastic core stock layers 4 and 7 are then placed together in a collating machine along with the clear protective overlay layers 1 and 10, which are respectively placed over layers 2 and 9. While still in this arrangement, the entire lay-up is lightly tack welded together using heat welding to form a composite assembly. The composite assembly is then placed in a lamination machine for heat lamination. Individual cards can now be cut to size out of the laminated assembly.

15 Note that in one of the examples below (example 6), the light filtering coating layer 5 is omitted and a more concentrated light filtering coating layer 6 is used. In this same example, a matte finish is also used to provide additional near Infrared light blockage. In two other examples (examples 7 and 8), both of the light filtering coating layers 3 and 8, which are translucent coating layers, are left out in order to produce a transparent card.

Example 6

20 Cards produced according to this example have all of the ten (10) layers shown in Fig. 8 and described above, with the exception of the light filtering coating layer 5, which is not used, thus yielding a nine (9) layer card with three (3) filtering layers. One of the filtering layers (layer 6) is a light absorbing filter layer that also has light scattering properties. The remaining two filtering layers (layers 3 and 8) are light scattering filter layers. The cards of 25 this example also have a matte finished applied to layer 1. The matte finish reduces the amount of source light that travels unidirectionally through the card to a card sensing device detector

by approximately 50%. Note that the use of matte finish coatings on financial transaction cards is generally known in the art. The specific materials and processing methods used to form the layers of the cards of this example are identified in the table below:

Layer 1	1.8 mil clear vinyl film of conventional design. Matte finish applied during production lamination using conventional processing.		
Layer 2	Lithographic print pass		
Layer 3	FM Group 17923 Silk Frost Ink		Applied as a coating with 305 mesh screen
Layer 4	13 mil clear vinyl sheet of conventional design		
Layer 5	No Layer 5		
Layer 6	Epelight III-57 BASF Sudan Blue 670 CK Interplast Red UV5411 BHT 3M W-210 Zeeospheres Nazdar VF190 Nazdar 132688A	69.00g 7.20g 6.00g 30.00g 30.00g 780.00g 300.00g 4777.80g	Applied as a coating with 305 mesh screen
Layer 7	13 mil clear vinyl sheet of conventional design		
Layer 8	FM Group 8130191 Satin Frost Pigment Nazdar 132688A Uvitex OB Degussa Acematt HK450	101.00g 869.00g 25.00g 5.00g	Applied as a coating with 305 mesh Screen
Layer 9	Lithographic print pass		
Layer 10	1.8 mil clear vinyl film of conventional design with conventional adhesive coating		

5 It will be seen that the many of the filter components in the above table are the same materials described in earlier examples, including the Epelight III-57 light absorbing filtering

component of layer 6. Unless otherwise indicated, all of the filter components described in the earlier examples are prepared in the same manner described in such examples but with the addition of the several materials that are newly listed in the current example. These are the BASF Sudan Blue 670 material, the CK Interplast Red material, the BHT material, and the 3M W-210 Zeeospheres used in the light absorbing filter layer 6. Additional newly disclosed materials in this example are the FM Group 17923 Silk Frost ink of the light scattering filter layer 3, and the FM Group 8130191 Satin Frost pigment and Degussa Acematt HK450 material of the light scattering filter layer 8.

The BASF Sudan Blue 670 material is an organic solvent-soluble blue dye used as a blue colorant in the light absorbing filter layer 6 (containing the Epolight III-57). It is produced by BASF Aktiengesellschaft of Mannheim, Germany. The CK Interplast Red material is another organic solvent-soluble red dye used as a red colorant in the light absorbing filter layer 6. It is produced by CK Colors, Inc. of Charlotte, NC. The BHT material is butylatedhydroxytoluene preservative, which acts as an antioxidant in the light absorbing filter layer 6. The 3M W-210 Zeeospheres are light scattering ceramic spheres produced by 3M Corporation of St. Paul, MN. They vary in size between about 1-12 microns. These spheres are also added to the light absorbing filter of layer 6 and decrease the amount of the Epolight III-57 absorber required therein due to their ability to scatter near Infrared light. This helps reduce the yellow tinting effect that the Epolight material has on the overall card. The 3M W-210 Zeeospheres also prevent the light absorbing filter layer 6 from being compressed during lamination. The FM Group 17923 Silk Frost ink and the 8130191 Satin Frost pigment that are respectively used in the light scattering filter layers 3 and 8 are light scatterers made by FM Group, Inc. of Sloatsburg, NY. These materials are sometimes referred to as "pearlescent" and have the ability to scatter or reflect light over a broad wavelength range. Thus, although they increase opacity in the near Infrared range, they also increase opacity relative to visible light. In addition to their light scattering properties, the FM Group materials help mask the light filtering layer 6, which has the yellow-tinted Epolight III-57 material therein that tends to color the overall card notwithstanding the presence of the BASF and CK colorants. The Degussa Acematt HK 450 material is a silica powder sold by Degussa-Huls Corporation of Ridgefield Park, NJ. This material is used as a processing additive to prevent sheet sticking, as is known in the art.

Cards produced in accordance with this example were translucent in the visible light range and had a soft whitish gray appearance. The measured near Infrared opacity at the least opaque location of the cards was about 1.6 (3% transmittance) at 950 nm and about 1.5 (3% transmittance) at 890 nm. In the visible light range, the opacity at the least opaque location on the cards was about 0.7 (20% transmittance), as measured by the X-Rite 361T Densitometer (see above) between 400-750 nm.

Example 7

Cards produced in accordance with this example have all of the ten (10) layers shown in Fig. 8 and described above, with the exception of the light filtering coating layers 3 and 8, which were not used, thus yielding an eight (8) layer card. Note from Example 6 above that the missing layers 3 and 8 are the light scattering layers respectively containing the FM Group 17923 Silk Frost ink and the FM Group Satin Frost 8130191 pigment. On the other hand, the light absorbing filter layer 5 has been added back in, such that the cards of this example have two light absorbing filtering layers (layers 5 and 6). The specific materials and processing methods that were used to form the layers of the cards of this example are identified in the table below:

Layer 1	1.8 mil clear vinyl film of conventional design. Matte finish applied during production lamination using conventional processing.		
Layer 2	Lithographic print pass		
Layer 3	No Layer 3		
Layer 4	13 mil clear vinyl sheet of conventional design		
Layer 5	Epolight III-57 UV5411 BHT 3M W-210 Zeeospheres Nazdar VF190 Nazdar 132688A	15.00g 5.00g 5.00g 130.00g 50.00g 795.00g	Applied as a coating with 305 mesh screen
Layer 6	Epolight III-57 UV5411	15.00g 5.00g	Applied as a coating with 305 mesh screen

	BHT	5.00g	
	3M W-210 Zeeospheres	130.00g	
	Nazdar VF190	50.00g	
	Nazdar 132688A	795.00g	
Layer 7	13 mil clear vinyl sheet of conventional design		
Layer 8	No Layer 8		
Layer 9	Lithographic print pass		
Layer 10	1.8 mil clear vinyl film of conventional design with conventional adhesive coating		

Note that the two light absorbing layers (layers 5 and 6) containing the light absorbing dye Epolight III-57 lack any added colorants. Cards produced in accordance with this example were transparent in the visible light range and had a strongly yellowish-slightly green

5 appearance. The measured near Infrared opacity at the least opaque location of the cards was about 1.9 (1.3% transmittance) at 950 nm and about 1.4 (4% transmittance) at 890 nm. In the visible light range, the opacity at the least opaque location on the cards was about 0.2 (63% transmittance), as measured by the X-Rite 361T Densitometer (see above) between 400-750 nm.

10 Example 8

Cards produced in accordance with this example have all of the ten (10) layers shown in Fig. 8 and described above, with the exception of the light filtering coating layers 3 and 8, which were not used, thus yielding an eight (8) layer card. Note from Example 6 above that the missing layers 3 and 8 are the light scattering layers containing the FM Group 17923 Silk
15 Frost ink and the 8130191 pearlescent pigment. On the other hand, as in example 7, the light absorbing filter layer 5 has been added back in, such that the cards of this example have two light absorbing filtering layers (layers 5 and 6). The specific materials and processing methods that were used to form the layers of the cards of this example are identified in the table below:

Layer 1	1.8 mil clear vinyl film of conventional design. Matte finish applied during production lamination using conventional processing.
Layer 2	Lithographic print pass

Layer 3	No Layer 3		
Layer 4	13 mil clear vinyl sheet of conventional design		
Layer 5	Epolight III-57 BASF Sudan Blue 670 CK Interplast Red UV5411 BHT 3M W-210 Zeeospheres Nazdar VF190 Nazdar 132688A	12.00g 3.75g 2.75g 5.00g 5.00g 130.00g 50.00g 791.50g	Applied as a coating with 305 mesh screen
Layer 6	Epolight III-57 BASF Sudan Blue 670 CK Interplast Red UV5411 BHT 3M W-210 Zeeospheres Nazdar VF190 Nazdar 132688A	12.00g 3.75g 2.75g 5.00g 5.00g 130.00g 50.00g 791.50g	Applied as a coating with 305 mesh screen
Layer 7	13 mil clear vinyl sheet of conventional design		
Layer 8	No Layer 8		
Layer 9	Lithographic print pass		
Layer 10	1.8 mil clear vinyl film of conventional design with conventional adhesive coating		

Note that the two light absorbing layers (layers 5 and 6) containing the light absorbing dye Epolight III-57 have the blue and red colorants of example 6. Cards produced in accordance with this example were transparent in the visible light range and had a neutral dark gray appearance. The measured near Infrared opacity at the least opaque location of the cards was about 1.6 (3% transmittance) at 950 nm and about 1.1 (9% transmittance) at 890 nm. In

the visible light range, the opacity at the least opaque location on the cards was about 0.5 (32% transmittance), as measured by the X-Rite 361T Densitometer (see above) between 400-750 nm.

Example 9

5 Cards produced in accordance with this example have all of the ten (10) layers shown in Fig. 8 and described above. These layers include two light absorbing filter layers (layers 5 and 6) and two light scattering filter layers (layers 3 and 8) for a total of four filtering layers. The specific materials and processing methods that were used to form the layers of the cards of this example are identified in the table below:

Layer 1	1.8 mil clear vinyl film of conventional design. Matte finish applied during production lamination using conventional processing.		
Layer 2	Lithographic print pass		
Layer 3	No Layer 3		
Layer 4	13 mil clear vinyl sheet of conventional design		
Layer 5	Epelight III-57	12.00g	Applied as a coating with 305 mesh screen
	Nazdar VF422 Reflex Blue	20.00g	
	BASF Sudan Blue 670	3.75g	
	CK Interplast Red	2.75g	
	UV5411	5.00g	
	BHT	5.00g	
	3M W-210 Zeeospheres	130.00g	
	Nazdar VF190	50.00g	
Layer 6	Nazdar 132688A	771.50g	
	Epelight III-57	12.00g	Applied as a coating with 305 mesh screen
	Nazdar VF422 Reflex Blue	20.00g	
	BASF Sudan Blue 670	3.75g	
	CK Interplast Red	2.75g	
	UV5411	5.00g	

	BHT	5.00g	
	3M W-210 Zeeospheres	130.00g	
	Nazdar VF190	50.00g	
	Nazdar 132688A	771.50g	
Layer 7	13 mil clear vinyl sheet of conventional design		
Layer 8	No Layer 8		
Layer 9	Lithographic print pass		
Layer 10	1.8 mil clear vinyl film of conventional design with conventional adhesive coating		

Note that the two light absorbing layers 5 and 6 containing the light absorbing dye Epolight III-57 include the two colorants of example 6 as well as an additional colorant not seen in any of the previous examples. This is the Nazdar VF422 Reflex Blue liquid colorant (comprising resin and pigment) from Nazdar Corporation. This colorant is an organic solvent-soluble dye having a blue tint. It will also be seen that the two light scattering layers 3 and 8 use a different light scattering material than seen in previous examples. This is the EM Industries Afflair 225 Rutile Blue Pearl material from EM Industries, Inc., Chemicals and Pigment Division, of Hawthorne, NY. This material a powdered pigment that is pearlescent in nature.

Cards produced in accordance with this example were translucent in the visible light range and had a bluish appearance. The measured near Infrared opacity at the least opaque location of the cards was about 1.8 (2% transmittance) at 950 nm and about 1.3 (5% transmittance) at 890 nm. In the visible light range, the opacity at the least opaque location on the cards was about 0.6 (25% transmittance), as measured by the X-Rite 361T Densitometer (see above) between 400-750 nm.

Accordingly, a financial transaction card that is transparent or translucent to human viewing yet detectable by automated card processing equipment has been disclosed. While various embodiments have been shown and described, it should be apparent that many variations and alternative embodiments would be apparent to those skilled in the art in view of the teachings herein. For example, although specific automated card processing equipment with characteristic source/detector wavelength and opacity requirements are described, it will

be appreciated that the concepts of the present invention can be applied to financial transaction cards used in other equipment having different wavelength and opacity requirements. In addition, although specific filter constructions are described it will be appreciated that many other filter designs may be utilized to achieve successful implementation of the invention. It
5 will be understood, therefore, that the invention is not to be in any way limited except in accordance with the spirit of the appended claims and their equivalents.

CLAIMS

What is claimed is:

- 1 1. A financial transaction card that is transparent or translucent to human viewing yet
2 detectable by automated card processing equipment, comprising:
3 a substantially planar material sheet having upper and lower surfaces bounded by a
4 continuous peripheral edge;
5 said material sheet having one or more areas that are at least minimally transparent or
6 translucent to human viewing; and
7 a filter associated with at least one of said one or more areas, said filter
8 providing sufficient opacity to light that is used by card sensors in said automated card
9 processing equipment to render said card detectable by said equipment.

- 1 2. A financial transaction card in accordance with Claim 1 wherein said card transmits
2 human visible light with at least about 15% transmittance.

- 1 3. A financial transaction card in accordance with Claim 1 wherein said automated card
2 processing equipment includes card embossing/encoding machines having source/detector
3 pairs operating in a light wavelength range of about 830-1100 nm, and wherein said filter has
4 an opacity relative to one or more specific wavelengths within said range of not substantially
5 less than about 1.0.

- 1 4. A financial transaction card in accordance with Claim 3 wherein said one or more
2 specific wavelengths include about 920 nm and about 950 nm.

- 1 5. A financial transaction card in accordance with Claim 1 wherein said automated card
2 processing equipment includes card readers having source/detector pairs operating in a light
3 wavelength range of about 750-1200 nm, and wherein said filter has an opacity relative to one
4 or more specific wavelengths within said range of not substantially less than about 1.0.

1 6. A financial transaction card in accordance with Claim 5 wherein said one or more
2 specific wavelengths include about 890 nm and about 950 nm.

1 7. A financial transaction card in accordance with Claim 1 wherein said automated card
2 processing equipment includes card embossing/encoding machines having source/detector
3 pairs operating in a light wavelength range of about 830-1100 nm, and card readers having
4 source/detector pairs operating in a light wavelength range of about 750-1200 nm, and wherein
5 said filter has an opacity relative to one or more specific wavelengths within said 750-1200 nm
6 range of not substantially less than about 1.0.

1 8. A financial transaction card in accordance with Claim 7 wherein said one or more
2 specific wavelengths include about 890 nm, about 920 nm, and about 950 nm.

1 9. A financial transaction card in accordance with Claim 1 wherein said filter is a light
2 absorbing material, a light reflecting material, a light deflecting material, or a combination of
3 two or more such materials.

1 10. A financial transaction card in accordance with Claim 1 wherein said filter is formed as
2 a filter coating, film or deposition applied or secured to said material sheet.

1 11. A financial transaction card in accordance with Claim 10 wherein said filter is a clear,
2 light absorbing material providing the requisite light filtering properties.

1 12. A financial transaction card in accordance with Claim 10 wherein said filter is formed
2 from a light absorbing dye.

1 13. A financial transaction card in accordance with Claim 10 wherein said filter is formed
2 from a light reflecting material.

1 14. A financial transaction card in accordance with Claim 10 wherein said filter is formed
2 from a light scattering material.

1 15. A financial transaction card in accordance with Claim 1 wherein said filter is formed
2 from a light filtering material disbursed through all or a portion of said material sheet.

1 16. A method for manufacturing a financial transaction card that is transparent or
2 translucent to human viewing yet detectable by automated card processing equipment,
3 comprising the steps of:

4 forming a substantially planar material sheet having upper and lower surfaces bounded
5 by a continuous peripheral edge;

6 said material sheet being formed with one or more areas that are least minimally
7 transparent or translucent to human viewing; and

8 associating a filter with at least a portion of said material sheet, said filter providing
9 sufficient opacity to light that is used by card sensors in said automated card processing
10 equipment to render said card detectable by said equipment.

1 17. A method in accordance with Claim 16 wherein said card transmits human visible light
2 with at least about 15% transmittance.

1 18. A method in accordance with Claim 16 wherein said automated card processing
2 equipment includes card embossing/encoding machines having source/detector pairs operating
3 in a light wavelength range of about 830-1100 nm, and wherein said filter is constructed to
4 have an opacity relative to one or more specific wavelengths within said range of not
5 substantially less than about 1.0.

1 19. A method in accordance with Claim 18 wherein said one or more specific wavelengths
2 include about 920 nm and about 950 nm.

1 20. A method in accordance with Claim 16 wherein said automated card processing
2 equipment includes card readers having source/detector pairs operating in a light wavelength
3 range of about 750-1200 nm, and wherein said filter is constructed to have an opacity relative
4 to one or more specific wavelengths within said range of not substantially less than about 1.0.

1 21. A method in accordance with Claim 20 wherein said one or more specific wavelengths
2 include about 890 nm and about 950 nm.

1 22. A method in accordance with Claim 16 wherein said automated card processing
2 equipment includes card embossing/encoding machines having source/detector pairs operating
3 in a light wavelength range of about 830-1100 nm, and card readers having source/detector
4 pairs operating in a light wavelength range of about 750-1200 nm, and wherein said filter is
5 constructed to have an opacity relative to one or more specific wavelengths within said 750-
6 1200 nm range of not substantially less than about 1.0.

1 23. A method in accordance with Claim 22 wherein said one or more specific wavelengths
2 include about 890 nm, about 920 nm, and about 950 nm.

1 24. A method in accordance with Claim 16 wherein said filter is a light absorbing material,
2 a light reflecting material, a light deflecting material, or a combination of two or more such
3 materials.

1 25. A method in accordance with Claim 16 wherein said filter is formed as a filter coating,
2 film or deposition applied or secured to said material sheet.

1 26. A method in accordance with Claim 25 wherein said filter is formed from a clear light
2 absorbing material providing the requisite light filtering properties.

1 27. A method in accordance with Claim 25 wherein said filter is formed from a light
2 absorbing dye.

1 28. A method in accordance with Claim 25 wherein said filter formed from a light
2 reflecting material.

1 29. A method in accordance with Claim 25 wherein said filter formed from a light
2 scattering material.

1 30. A method in accordance with Claim 16 said filter is formed from a light filtering
2 material disbursed through all or a portion of said material sheet.

1 31. A financial transaction card that is transparent or translucent to human viewing yet
2 detectable by automated card processing equipment, comprising:
3 a sheet of material having one or more areas that are at least minimally transparent or
4 translucent to human viewing; and
5 means associated with at least one of said areas for rendering said card detectable by
6 source/detector pairs in said automated processing equipment.

1 32. A financial transaction card in accordance with Claim 31 wherein said means is a filter
2 applied to said material sheet as a liquid coating.

1
2 33. A financial transaction card in accordance with Claim 32 wherein said filter is made
3 from a light absorbing dye material dissolved in a liquid coating material at a dye-to-coating
4 weight ratio of up to about 20%.

1 34. A financial transaction card in accordance with Claim 32 wherein said filter is made
2 from a light absorbing dye material dissolved in a liquid coating material at a dye-to-coating
3 weight ratio of between about 0.2-5.0%.

1 35. A financial transaction card in accordance with Claim 32 wherein said filter is made
2 from a light absorbing dye material dissolved in a liquid coating material at a dye-to-coating
3 weight ratio of between about 0.5-3.5%.

1 36. A financial transaction card in accordance with Claim 32 wherein said filter is made
2 from a light absorbing dye material dissolved in a liquid coating material at a weight ratio of
3 about 1.0-2.5%.

1 37. A financial transaction card in accordance with Claim 32 wherein said liquid coating
2 comprises a plastic resin-based coating material.

1 38. A financial transaction card in accordance with Claim 32 wherein said liquid coating is
2 applied to said material sheet by screen printing.

1 39. A financial transaction card in accordance with Claim 38 wherein said screen printing
2 is performed using a screen mesh size of between about 90-390 mesh.

1 40. A financial transaction card in accordance with Claim 38 wherein said filter is made
2 from a light absorbing dye material dissolved in a liquid coating material and said screen
3 printing is performed using a screen mesh size of about 195 mesh.

1 41. A financial transaction card in accordance with Claim 38 wherein said filter is made
2 from a light absorbing dye material dissolved in a liquid coating material and said screen
3 printing is performed using a screen mesh size of about 305 mesh.

1 42. A financial transaction card in accordance with Claim 33 wherein said liquid coating
2 material is a plastic resin-based coating.

1 43. A financial transaction card in accordance with Claim 33 wherein a colorant is added to
2 said filter to provide a desired color or tint.

1 44. A financial transaction card in accordance with Claim 43 wherein said dye is a dye
2 material that produces a yellow tint and wherein said colorant is a violet colorant material that
3 combines with said yellow tint of said dye material to provide a neutral gray tint in said card.

1 45. A financial transaction card in accordance with Claim 33 wherein between about 2-4
2 layers of said dye material and said liquid coating material are applied to said material sheet.

1 46. A financial transaction card in accordance with Claim 33 wherein said card has an
2 opacity of at least approximately 1.0 relative to one or more selected light wavelengths
3 corresponding to the output of light sources used in said automated card processing equipment.

1 47. A financial transaction card in accordance with Claim 46 wherein said card has an
2 opacity of at least approximately 1.0 relative to light wavelengths of about 890 nm and about
3 950 nm.

1 48. A financial transaction card in accordance with Claim 46 wherein said card has an
2 opacity of at least approximately 1.0 relative to light wavelengths of about 920 nm and about
3 950 nm.

1 49. A financial transaction card in accordance with Claim 43 wherein said colorant is a dye
2 colorant.

1 50. A financial transaction card in accordance with Claim 43 wherein said colorant is a
2 fluorescent material.

1 51. A financial transaction card in accordance with Claim 43 wherein said colorant is a
2 light scattering material.

1 52. A financial transaction card in accordance with Claim 43 wherein said colorant includes
2 a fluorescent material and a light scattering material.

1 53. A financial transaction card in accordance with Claim 32 wherein said filter includes a
2 fluorescent material.

1 54. A financial transaction card in accordance with Claim 32 wherein said filter includes a
2 light scattering material.

1 55. A financial transaction card in accordance with Claim 32 wherein said filter includes a
2 fluorescent material and a light scattering material.

1 56. A financial transaction card in accordance with Claim 32 wherein said filter includes an
2 Ultraviolet light absorber.

1 57. A financial transaction card in accordance with Claim 32 wherein said filter is made
2 from an organic solvent-soluble, near Infrared absorption dye and an Ultraviolet light
3 absorbing material dissolved in a plastic resin-based coating material.

1 58. A financial transaction card in accordance with Claim 32 wherein said coating is made
2 from a vinyl resin-based coating material that includes (by weight) about 20-25% vinyl resins,
3 about 35-40% aromatic petroleum distillates, about 5-10% cyclohexanone, about 5-10%
4 diacetone alcohol, about 5-10% gamma butyrolactone, less than about 5% naphthalene, and
5 about 2% aliphatic petroleum distillates, and wherein said coating is further made from a
6 thinner comprising all of the components of said coating material at the same ratios, with the
7 exception of said vinyl resins which are not present in said thinner.

1 59. A financial transaction card in accordance with Claim 58 wherein said filter is
2 made from one or more layers comprising a mixture of a first organic solvent-soluble, near
3 Infrared absorption dye, a second organic solvent-soluble, near Infrared absorption dye, said
4 second dye having more Ultraviolet light and/or heat stability than said first dye, an organic
5 solvent-soluble red colorant, an organic solvent-soluble blue colorant, said thinner and said
6 vinyl resin-based coating material.

1 60. A financial transaction card in accordance with Claim 59 wherein the respective
2 proportions of said first dye, said second dye, said red colorant, said blue colorant, said thinner,
3 and said vinyl resin-based coating material in said mixture are about 22:3:0.25:0.35:110:990 by
4 weight, and wherein two filter layers of said mixture are used to produce a card having an
5 opacity of approximately 0.4 at a wavelength of about 550 nm, approximately 1.3 at a
6 wavelength of about 890 nm, and approximately 1.7 at a wavelength of about 950 nm.

1 61. A financial transaction card in accordance with Claim 59 wherein the respective
2 proportions of said first dye, said second dye, said red colorant, said blue colorant, said thinner,
3 and said vinyl resin-based coating material in said mixture are about 22:3:0.25:0.35:110:990 by
4 weight, and wherein three filter layers of said mixture are used to produce a card having an

5 opacity of approximately 0.6 at a wavelength of about 550 nm, approximately 1.5 at a
6 wavelength of about 890 nm and approximately 1.9 at a wavelength of about 950 nm.

1 62. A financial transaction card in accordance with Claim 59 wherein the respective
2 proportions of said first dye, said second dye, said red colorant, said blue colorant, said thinner,
3 and said vinyl resin-based coating material in said mixture are about 22:3:0.25:0.35:110:990 by
4 weight, and wherein four filter layers of said mixture are used to produce a card having an
5 opacity of approximately 0.6 at a wavelength of about 550 nm, approximately 2.0 at a
6 wavelength of about 890 nm and approximately 2.5 at a wavelength of about 950 nm.

1 63. A financial transaction card in accordance with Claim 58 wherein said filter is
2 made from one or more layers comprising a mixture of an organic solvent-soluble, near
3 Infrared absorption dye, an organic solvent-soluble Ultraviolet (UV) light absorber, an organic
4 solvent-soluble fluorescent blue colorant, an organic solvent-soluble fluorescent red colorant,
5 said thinner and said vinyl resin-based coating material.

1 64. A financial transaction card in accordance with Claim 63 wherein the respective
2 proportions of said dye, said UV absorber, said blue colorant, said red colorant, said thinner,
3 and said vinyl resin-based coating material in said mixture are about
4 13:4.33:21.66:21.66:130:633 by weight, and wherein three filter layers of said mixture are used
5 to produce a card having an opacity of approximately 0.2 at a wavelength of about 550 nm and
6 approximately 1.0 at a wavelength of about 950 nm.

1 65. A financial transaction card in accordance with Claim 58 wherein said filter is
2 made from one or more layers comprising a mixture of an organic solvent-soluble, near
3 Infrared absorption dye, an organic solvent-soluble Ultraviolet light (UV) absorber, and said
4 vinyl resin-based coating material.

1 66. A financial transaction card in accordance with Claim 65 wherein the respective
2 proportions of said dye, said UV absorber, and said vinyl resin-based coating material in said
3 mixture are about 15:4.5:980.5 by weight, and wherein one filter layer of said mixture is used

4 to produce a card having an opacity of approximately 0.2 at a wavelength of about 550 nm and
5 approximately 1.2 at a wavelength of about 950 nm.

1 67. A financial transaction card in accordance with Claim 58 wherein said filter is disposed
2 on one side of said material sheet and a light scattering film is disposed on the other side of
3 said material sheet.

1 68. A financial transaction card in accordance with Claim 67 wherein said filter is
2 made from one or more layers comprising a first mixture of an organic solvent-soluble, near
3 Infrared absorption dye, an organic solvent-soluble Ultraviolet (UV) light absorber, an organic
4 solvent-soluble fluorescent blue colorant, an organic solvent-soluble fluorescent red colorant,
5 said thinner and said vinyl resin-based coating material, and wherein said light scattering film
6 is made from one or more layers comprising a second mixture of a translucent light scattering
7 material, an organic solvent-soluble fluorescent whitening agent and said vinyl resin-based
8 coating material.

1 69. A financial transaction card in accordance with Claim 68 wherein the respective
2 proportions of said dye, said UV absorber, said fluorescent blue colorant, said fluorescent red
3 colorant, said thinner, and said vinyl resin-based coating material in said first mixture are about
4 13:4.33:65:21.66:130:633 by weight, wherein the respective proportions of said light scattering
5 material, said fluorescent whitening agent and said vinyl resin-based coating material in said
6 second mixture are about 90:2.5:907.5, wherein one filter layer of said first mixture and said
7 light scattering film coated with said second mixture are used to produce a card having an
8 opacity of approximately 0.8 at a wavelength of about 550 nm and approximately 1.5 at a
9 wavelength of about 950 nm.

1 70. A financial transaction card in accordance with Claim 32 wherein said filter is made
2 from an organic solvent-soluble, near Infrared absorption dye, an organic solvent-soluble
3 Ultraviolet light absorbing material, and one or more organic solvent-soluble colorants
4 dissolved in a vinyl resin-based coating.

1 71. The financial transaction card of Claim 32 wherein said filter is made from an organic
2 solvent-soluble, near Infrared absorption dye, an organic solvent-soluble Ultraviolet light
3 absorbing material, and one or more organic solvent-soluble fluorescent materials dissolved in
4 one or more vinyl resin-based coatings.

1 72. The financial transaction card of Claim 32 wherein said filter is made from an organic
2 solvent-soluble, near Infrared absorption dye, an organic solvent-soluble Ultraviolet light
3 absorbing material, and one or more light scattering materials dissolved in one or more vinyl
4 resin-based coatings.

1 73. The financial transaction card of Claim 32 wherein said card transmits human visible
2 light with at least about 15% transmittance.

1 74. A financial transaction card that is transparent or translucent to human viewing yet
2 detectable by automated card processing equipment, comprising:
3 a pair of substantially planar material sheets each having opposing first surfaces and
4 non-opposing second surfaces, said surfaces being bounded by a continuous peripheral edge;
5 said material sheets being at least minimally transparent or translucent to human
6 viewing;

7 a light filtering coating formed on one or both of said first surfaces;
8 printed graphics formed over said second surfaces;
9 clear protective overlay sheets formed over said printed graphics; and
10 said card providing sufficient opacity to light that is detectable by sensors in said
11 automated card processing equipment to render said card detectable by said equipment.

1 75. The financial transaction card of Claim 74 wherein there is a light filtering coating
2 formed one each of said first surfaces.

1 76. The financial transaction card of Claim 74 further including a light filtering coating
2 formed on one or both of said second surfaces.

1 77. The financial transaction card of Claim 76 wherein there is a light filtering coating
2 formed on each of said second surfaces.

1 78. The financial transaction card of Claim 74 wherein said light filtering coating is a light
2 absorbing coating.

1 79. The financial transaction card of Claim 75 wherein said light filtering coatings are light
2 absorbing coatings.

1 80. The financial transaction card of Claim 76 wherein said light filtering coating on one or
2 both of said first surfaces is a light absorbing coating and said light filtering coating on one or
3 both of said second surfaces is a light scattering coating.

1 81. The financial transaction card of Claim 77 wherein said light filtering coating on one or
2 both of said first surfaces is a light absorbing coating and said light filtering coatings on said
3 second surfaces are light scattering coatings.

1 82. The financial transaction card of Claim 78 wherein said light absorbing coating
2 includes a light absorbing dye.

1 83. The financial transaction card of Claim 82 wherein said light absorbing coating
2 includes a colorant.

1 84. The financial transaction card of Claim 83 wherein said light absorbing coating
2 includes a light scattering material.

1 85. The financial transaction card of Claim 81 wherein one of said light scattering coatings
2 comprises a pearlescent ink material and the other of said light scattering coatings comprises a
3 pearlescent pigment material .

1 86. The financial transaction card of Claim 85 wherein one of said light scattering coatings
2 comprises a silica powder.

1 87. The financial transaction card of Claim 77 wherein:

2 (1) there is a light filtering coating formed on one of said first surfaces that is made
3 from a filtering mixture that includes an organic solvent-soluble, near Infrared absorption dye,
4 an organic solvent-soluble blue colorant, an organic solvent-soluble red colorant, an organic
5 solvent-soluble Ultraviolet (UV) light absorber, a BHT preservative, a light scattering ceramic
6 sphere material, a solvent-based thinner and a vinyl resin-based coating material, said vinyl
7 resin-based coating material including (by weight) about 20-25% vinyl resins, about 35-40%
8 aromatic petroleum distillates, about 5-10% cyclohexanone, about 5-10% diacetone alcohol,
9 about 5-10% gamma butyrolactone, less than about 5% napthalene, and about 2% aliphatic
10 petroleum distillates, and said thinner comprising all of the components of said coating
11 material at the same ratios, with the exception of said vinyl resins which are not present in said
12 thinner, said dye, said blue colorant, said red colorant, said UV absorber, said preservative, said
13 ceramic sphere material, said thinner and said vinyl resin-based coating material being present
14 in said filtering mixture at respective proportions of about 69:7.2:6:30:30:780:300:4777.8 by
15 weight;

16 (2) said light filtering coating formed on one of said second surfaces is made from a
17 pearlescent ink;

18 (3) said light filtering coating formed on the other of said second surfaces is made from
19 a light scattering mixture that includes an organic solvent-soluble pearlescent pigment, an
20 organic solvent-soluble fluorescent whitening agent, a powdered silica material, and a vinyl
21 resin-based coating material, said vinyl resin-based coating material including (by weight)
22 about 20-25% vinyl resins, about 35-40% aromatic petroleum distillates, about 5-10%
23 cyclohexanone, about 5-10% diacetone alcohol, about 5-10% gamma butyrolactone, less than
24 about 5% napthalene, and about 2% aliphatic petroleum distillates, said pearlescent pigment,
25 said fluorescent whitening agent, said powdered silica material, and said vinyl resin-based
26 coating material being present in said light scattering mixture at respective proportions of about
27 101:25:5:869 by weight; and

28 (4) said card has an opacity of approximately 0.7 over a wavelength range of about 400-
29 750 nm, approximately 1.5 at a wavelength of about 890 nm, and approximately 1.6 at a
30 wavelength of about 950 nm.

1 88. The financial transaction card of Claim 75 wherein:

2 (1) there is a light filtering coating formed on each of said first surfaces that is made
3 from a filtering mixture that includes an organic solvent-soluble, near Infrared absorption dye,
4 an organic solvent-soluble Ultraviolet (UV) light absorber, a BHT preservative, a light
5 scattering ceramic sphere material, a solvent-based thinner and a vinyl resin-based coating
6 material, said vinyl resin-based coating material including (by weight) about 20-25% vinyl
7 resins, about 35-40% aromatic petroleum distillates, about 5-10% cyclohexanone, about 5-10%
8 diacetone alcohol, about 5-10% gamma butyrolactone, less than about 5% napthalene, and
9 about 2% aliphatic petroleum distillates, and said thinner comprising all of the components of
10 said coating material at the same ratios, with the exception of said vinyl resins which are not
11 present in said thinner, said dye, said UV absorber, said preservative, said ceramic sphere
12 material, said thinner and said vinyl resin-based coating material being present in said filtering
13 mixture at respective proportions of about 15:5:5:130:50:795 by weight; and

14 (2) said card has an opacity of approximately 0.2 over a wavelength range of about 400-
15 750 nm, approximately 1.4 at a wavelength of about 890 nm, and approximately 1.9 at a
16 wavelength of about 950 nm.

1 89. The financial transaction card of Claim 75 wherein:

2 (1) there is a light filtering coating formed on each of said first surfaces that is made
3 from a filtering mixture that includes an organic solvent-soluble, near Infrared absorption dye,
4 an organic solvent-soluble blue colorant, an organic solvent soluble red colorant, an organic
5 solvent-soluble Ultraviolet (UV) light absorber, a BHT preservative, a light scattering ceramic
6 sphere material, a solvent-based thinner and a vinyl resin-based coating material, said vinyl
7 resin-based coating material including (by weight) about 20-25% vinyl resins, about 35-40%
8 aromatic petroleum distillates, about 5-10% cyclohexanone, about 5-10% diacetone alcohol,
9 about 5-10% gamma butyrolactone, less than about 5% napthalene, and about 2% aliphatic
10 petroleum distillates, and said thinner comprising all of the components of said coating

11 material at the same ratios, with the exception of said vinyl resins which are not present in said
12 thinner, said dye, said blue colorant, said red colorant, said UV absorber, said preservative, said
13 ceramic sphere material, said thinner and said vinyl resin-based coating material being present
14 in said filtering mixture at respective proportions of about 12:3.75:2.75:5:5:130:50:791.5 by
15 weight; and

16 (2) said card has an opacity of approximately 0.5 over a wavelength range of about 400-
17 750 nm, approximately 1.1 at a wavelength of about 890 nm, and approximately 1.6 at a
18 wavelength of about 950 nm.

1 90. The financial transaction card of Claim 75 wherein:

2 (1) there is a light filtering coating formed on each of said first surfaces that is made
3 from a filtering mixture that includes an organic solvent-soluble, near Infrared absorption dye,
4 a solvent-based liquid blue colorant, an organic solvent-soluble blue colorant, an organic
5 solvent-soluble red colorant, an organic solvent-soluble Ultraviolet (UV) light absorber, a BHT
6 preservative, a light scattering ceramic sphere material, a solvent-based thinner and a vinyl
7 resin-based coating material, said vinyl resin-based coating material including (by weight)
8 about 20-25% vinyl resins, about 35-40% aromatic petroleum distillates, about 5-10%
9 cyclohexanone, about 5-10% diacetone alcohol, about 5-10% gamma butyrolactone, less than
10 about 5% naphthalene, and about 2% aliphatic petroleum distillates, and said thinner comprising
11 all of the components of said coating material at the same ratios, with the exception of said
12 vinyl resins which are not present in said thinner, said dye, said liquid blue colorant, said blue
13 colorant, said red colorant, said UV absorber, said preservative, said ceramic sphere material,
14 said thinner and said vinyl resin-based coating material being present in said filtering mixture
15 at respective proportions of about 12:20:3.75:2.75:5:5:130:50:771.5 by weight; and

16 (2) said card has an opacity of approximately 0.6 over a wavelength range of about 400-
17 750 nm, approximately 1.3 at a wavelength of about 890 nm, and approximately 1.8 at a
18 wavelength of about 950 nm.

ABSTRACT OF THE DISCLOSURE

A financial transaction card is transparent or translucent to human viewing yet detectable by automated card processing equipment. The card includes a substantially planar material sheet having upper and lower surfaces bounded by a continuous peripheral edge. The material sheet has one or more areas that are at least minimally transparent or translucent to human viewing. A filter associated with at least one of the areas provides sufficient opacity to light used by card sensors in the automated card processing equipment to render the card detectable.

DECLARATION FOR PATENT APPLICATION

Docket Number: 6499-4

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name. I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled "Transparent/Translucent Financial Transaction Card", the specification of which is attached hereto unless the following is checked:

was filed on _____ as United States Application Number or PCT International Application Number
and was amended on _____ if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, § 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed.

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application.

09/449,251 (Application Number)	October 1, 1999 (Filing Date)	Pending (Status - patented, pending, abandoned)
09/411,359 (Application Number)	November 24, 1999 (Filing Date)	Pending (Status - patented, pending, abandoned)

I hereby appoint the following attorney(s) and/or agent(s) to prosecute this application and to transact all business in the U.S. Patent and Trademark Office connected therewith: Joseph P. Gastel, Reg. #17,796 and Walter W. Duft, Reg. #31,948. Address all telephone calls to: Walter W. Duft at Telephone No. (716) 856-8000, and address all correspondence to: Walter W. Duft, Ellicott Square Building, 295 Main Street, Suite 762, Buffalo, N.Y. 14203-2507.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
